```
def draw_line(coef,intercept, mi, ma):
    # for the separating hyper plane ax+by+c=0, the weights are [a, b] and the intercept
is c
    # to draw the hyper plane we are creating two points
    # 1. ((b*min-c)/a, min) i.e ax+by+c=0 ==> ax = (-by-c) ==> x = (-by-c)/a here in plac
e of y we are keeping the minimum value of y
    # 2. ((b*max-c)/a, max) i.e ax+by+c=0 ==> ax = (-by-c) ==> x = (-by-c)/a here in plac
e of y we are keeping the maximum value of y
    points=np.array([[((-coef[0][1]*mi - intercept)/coef[0][0]), mi],[((-coef[0][1]*ma -
intercept)/coef[0][0]), ma]])
    plt.plot(points[:,0], points[:,1])
```

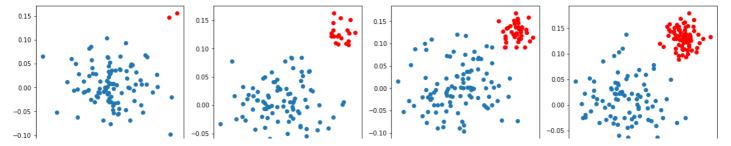

What if Data is imabalanced

- 1. As a part of this task you will observe how linear models work in case of data i mbalanced
- 2. observe how hyper plane is changs according to change in your learning rate.
- 3. below we have created 4 random datasets which are linearly separable and having class imbalance
- 4. in the first dataset the ratio between positive and negative is 100 : 2, in the 2nd data its 100:20,

in the 3rd data its 100:40 and in 4th one its 100:80

In []:

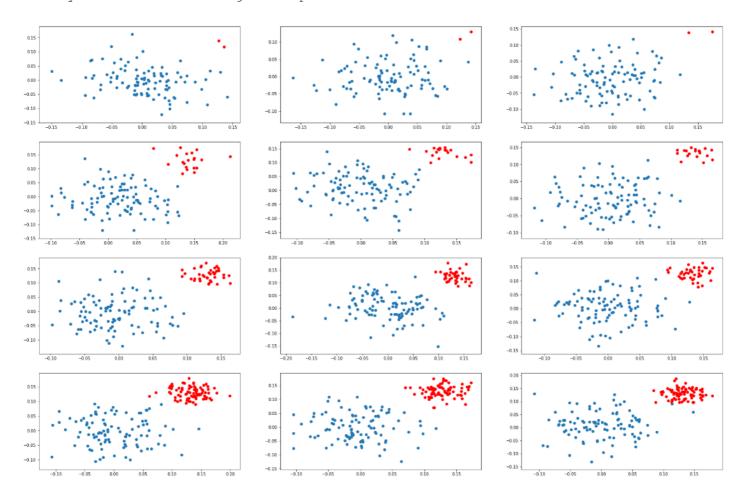

```
# here we are creating 2d imbalanced data points
ratios = [(100,2), (100, 20), (100, 40), (100, 80)]
plt.figure(figsize=(20,5))
for j,i in enumerate(ratios):
    plt.subplot(1, 4, j+1)
    X_p=np.random.normal(0,0.05,size=(i[0],2))
    X_n=np.random.normal(0.13,0.02,size=(i[1],2))
    y_p=np.array([1]*i[0]).reshape(-1,1)
    y_n=np.array([0]*i[1]).reshape(-1,1)
    X=np.vstack((X_p,X_n))
    y=np.vstack((Y_p,Y_n))
    plt.scatter(X_p[:,0],X_p[:,1])
    plt.scatter(X_n[:,0],X_n[:,1],color='red')
plt.show()
```

your task is to apply SVM (<u>sklearn.svm.SVC</u>) and LR (<u>sklearn.linear model.LogisticRegression</u>) with different regularization strength [0.001, 1, 100]

Task 1: Applying SVM

1. you need to create a grid of plots like this

in each of the cell[i][j] you will be drawing the hyper plane that you get after ap plying \underline{SVM} on ith dataset and $jth\ learnig\ rate$

i.e

```
Plane(SVM().fit(D1, C=0.001)) Plane(SVM().fit(D1, C=1)) Plane(SVM().fit(D1, C=100))

Plane(SVM().fit(D2, C=0.001)) Plane(SVM().fit(D2, C=1)) Plane(SVM().fit(D2, C=100))

Plane(SVM().fit(D3, C=0.001)) Plane(SVM().fit(D3, C=1)) Plane(SVM().fit(D3, C=100))

Plane(SVM().fit(D4, C=0.001)) Plane(SVM().fit(D4, C=1)) Plane(SVM().fit(D4, C=100))
```

if you can do, you can represent the support vectors in different colors, which will help us understand the position of hyper plane

Write in your own words, the observations from the above plots, an

what do you think about the position of the hyper plane

check the optimization problem here https://scikit-learn.org/stable/modules/svm.htm l#mathematical-formulation

if you can describe your understanding by writing it on a paper and attach the picture, or record a video upload it in assignment.

```

Observation

1.when C=0.001, the seperating plane did not do well in seperating positive and negative points, even when the data set is balanced.

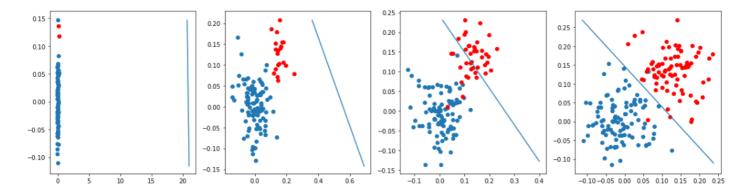

2.when C=1, seperator plane separates data much better when data in balanced ,and didnt do well when we have imbalances dataset.

3.when c=100, its the best seperator plane ,works well even if the data is not balanced, and works like magic with balanced data set

Task 2: Applying LR

you will do the same thing what you have done in task 1.1, except instead of SVM y ou apply <u>logistic regression</u>

these are results we got when we are experimenting with one of the model

In []:

```
#you can start writing code here.
import sklearn
from sklearn.linear_model import LogisticRegression
plt.figure(figsize = (25,20))
ratios = [(100,2), (100, 20), (100, 40), (100, 80)]
C=[0.001, 1, 100]
k=0
for j,i in enumerate(ratios):
   for c in C:
     plt.subplot(4, 3, k+1)
     k=k+1

                                                                                                            0.10
                                                                                                                 0.15
                                                                                                                     0.20
```

OBSERVATION

1.when C=0.001, model does not perform well, not able to seperate data points using seperator plane eventhough dataset is

2.when C=1,only performs well when dataset is balanced fully.

3.when C=100, works well even when data is slightly imbalanced, and works very well with balanced data
